The image shows a computer monitor displaying a web-based authentication interface. The title bar at the top of the browser window reads "UOG Library Patron Authentication". The main content area has a dark blue header with the text "UOG Library Patron Authentication" in white. Below this, the text "Welcome to the University of Guam Library." is displayed. A message follows: "The resources you have requested are restricted. Please enter:". There are two input fields: "Your barcode:" and "PIN:". Below the input fields is a "Login" button. In the bottom left corner of the browser window, the "DYNIX" logo is visible. The monitor's bezel shows the "ASUS" logo at the bottom center.

## A phase trial of the oral *Lactobacillus casei* vaccine polarizes Th2 cell immunity against transmissible gastroenteritis coronavirus infection

**Author:** Jiang, Xinpeng; Xingyu Hou; Lijie Tang; Yanping Jiang; Guangpeng Ma; Yijing Li

**Abstract:** Transmissible gastroenteritis **coronavirus** (TGEV) is a member of the genus **Coronavirus**, family Coronaviridae, order Nidovirales. TGEV is an enteropathogenic **coronavirus** that causes highly fatal acute diarrhoea in newborn pigs. An oral *Lactobacillus casei* (L. casei) **vaccine** against anti-transmissible gastroenteritis virus developed in our laboratory was used to study mucosal immune responses. In this L. casei **vaccine**, repetitive peptides expressed by L. casei (specifically the MDP and tuftsin fusion protein (MT)) were repeated 20 times and the D antigenic site of the TGEV spike (S) protein was repeated 6 times. **Immunization** with recombinant *Lactobacillus* is crucial for investigations of the effect of **immunization**, such as the first **immunization** time and dose. The first **immunization** is more important than the last **immunization** in the series. The recombinant *Lactobacillus* elicited specific systemic and mucosal immune responses. Recombinant L. casei had a strong potentiating effect on the cellular immunity induced by the oral L. casei **vaccine**. However, during TGEV infection, the systemic and local immune responses switched from Th1 to Th2-based immune responses. The systemic humoral immune response was stronger than the cellular immune response after TGEV infection. We found that the recombinant *Lactobacillus* stimulated IL-17 expression in both the systemic and mucosal immune responses against TGEV infection. Furthermore, the *Lactobacillus* **vaccine** stimulated an anti-TGEV infection Th17 pathway. The histopathological examination showed tremendous potential for recombinant *Lactobacillus* to enable rapid and effective treatment for TGEV with an intestinal tropism in piglets. The TGEV immune protection was primarily dependent on mucosal immunity.
